

Ancestor of lybica and silvestris

Early gene flow. m_{sl} is probability lineage in lybica came from silvestris; vice versa for m_{ls} .

Population size change to N_D at T_D caused by domestication

Early gene flow. m_{sd}^2 is probability lineage in domestic came from silvestris; vice versa for m_{ds}^2 .

This is the basic model. A tweak would be to model exponential population size change between T_A and T_B for wildcats and between T_A and T_D for lybica. And a similar size change from T_B and T_D to current time in wildcats and domestics, which would need the introduction of current population sizes N_{Bcurr} and N_{Dcurr} .
